

## PODZIĘKOWANIE

Dziękuję szczególnie mojemu promotorowi Prof. dr. hab. Janowi R. Olędzkiemu za zrozumienie i pomoc, za uwagi merytoryczne do mojej pracy.

Całemu zespołowi w Katedrze Geoinformatyki i Teledetekcji Uniwersytetu Warszawskiego za wsparcie techniczne oraz pomoc w przygotowaniu całej dokumentacji kartograficznej niezbędnej do sfinalizowania tej pracy.

Pracownikom biblioteki Wydziału (Basi, Dominice, Wiesiowi i innym) za radę, dobre słowo i pomoc techniczną.

Wykładowcom z Uniwersytetu Omar Bongo w Libreville (szczególnie Prof. Marc-Louis Ropivia) za mo-

ralne wsparcie dla mojej naukowej pracy w Polsce, czego dowodem jest wizyta wykładowców gabońskich w Warszawie w maju 2006 roku.

Mojej żonie, dzieciom Alexowi i Filipowi oraz jej rodzinie za zrozumienie moich godzin nieobecności obok nich, przekazuję bardzo wielkie podziękowania.

Rodzinie w Gabonie (Marie-Agnes, Gnougnou, Patricia i Alain, Albert, Pamphile, DIB) oraz przyjaciołom (Jean-Aimé Moukétou, Charles Midjaou, Grégoire i Dorocie Brault, Marzenie, Ani, Martin), którzy bezpośrednio lub pośrednio wspierali mnie w tej trudnej drodze pokonywania barier kulturowych, językowych wspierając mnie i dodając słowa otuchy w momentach zwątpienia.

## ABSTRACT

*Ecotourism is considered as the most attractive subset of tourism industry which can contribute natural resource conservation and local development if it is properly managed. Gabonese government, 2003, stated several advantages of establishing forest parks and natural recreation areas such as attracting larger numbers of tourists through providing a place for spending their leisure times as well as creating new jobs and natural resource conservation. Although great numbers of people annually visit Gabon, in Mougaldoudou, petit Loango, to enjoy its brilliant landscape and its moderate ecologic condition; still there isn't an applicable ecotourism plan for many natural attractive zones in this country. As a result, some specific most known areas would be threatened by being overused by visitors while other unknown or less familiar ones remain unvisited. Therefore, proper comprehensive ecotourism plans are required to prevent overusing most widely known forests as well as new*

*integrated plans for introducing the unknown potential areas to people. In this research, a feasibility study was conducted to identify potential ecotourism zones within the study area, and then applicable strategies were suggested for optimal exploitation of the area. Both Geographic Information System (GIS) and Remote Sensing (RS) techniques had accelerated our research process, enhanced the accuracy and reduced the expenses of this study. In continue, the map of slope, height and orientation had been produced using a SRTM DEM data in an ArcGIS environment. These three maps were overlaid to provide the Land shape map of the study area. The primary evaluations of available ecotourism potentials in the study area were carried out using Remote sensing data and methods. To make an accurate decision about the most appropriate ecotourism land use, two maps of soil and vegetation cover were overlaid to produce a geoenvironmental unit map.*
